Circular dichroism and circular birefringence are manifestations of optical activity. It is exhibited in the absorption bands of optically active chiral molecules. CD spectroscopy has a wide range of applications in many different fields. Most notably, UV CD is used to investigate the secondary structure of proteins.

Circular dichroism - Wikipedia

Circular dichroism (CD) deals with the interaction of plane polarized light (PPL) with an asymmetric molecule with subsequent differential absorption of left and right circularly polarized light components of PPL and it aims to explain structural features of biomolecules with empirical rules devised on the basis of the study of such interactions between PPL and model compounds whose detailed structure is well known.
